

```
public static int task11CP(String str) {  
    int count = 0; // Initialize the count of symmetrical substrings to zero  
    int n = str.length(); // Get the length of the input string  
    for (int center = 0; center < 2 * n - 1; center++) { // Loop through each possible center (2n - 1)  
        int left = center / 2; // if the center is a character, left and right pointers are the same  
        int right = left + center % 2; // if the center is between two characters, left and right pointers are different  
        while (left >= 0 && right < n && str.charAt(left) == str.charAt(right)) { // Loop as long as the substring is symmetrical  
            count++; // Increment the count for each symmetrical substring found  
            left--; // Move the left pointer to the left to check the next character  
            right++; // Move the right pointer to the right to check the next character  
        }  
    }  
    return count; // Return the total count of symmetrical substrings  
}
```

```
public static void main(String[] args) {  
    String input = "abba";  
    int result = task11CP(input);  
    System.out.println(result);  
}
```
